Subspace
Identification for
Linear Systems
focuses on the theory,

Implementation and applications of subspace identification algorithms for linear time-invariant finite-dimensional dynamical systems. These algorithms allow for a fast, straightforward and accurate determination of linear multivariable models

from measured input-output data. The theory of subspace identification algorithms is presented in detail. Several chapters are devoted to deterministic, stochastic and combined deterministic-stochastic subspace identification algorithms. For each

case, the geometric properties are stated in a main 'subspace' Theorem. Relations to existing algorithms and literature are explored, as are the interconnections between different subspace algorithms. The subspace identification theory is linked to the theory of frequency weighted

Model reduction,
which leads to new
interpretations and
insights. The
implementation of
subspace

algorithms is
discussed in terms of

which are well-established algorithms from numerical linear algebra. The algorithms are implemented in combination with a whole set of classical identification algorithms, processing and validation tools in Xmath's ISID, a

commercially

available graphical
user interface toolbox.

The basic subspace
algorithms in the book
are also implemented
in a set of Matlab files
accompanying the
book. An application
of ISID to an industrial
glass tube
manufacturing
process is presented
in detail, illustrating

the power and user-
friendliness of the
subspace
identification
algorithms and of their
implementation in
ISID. The identified
model allows for an
optimal control of the
process, leading to a
significant
enhancement of the
production quality.
The applicability of

is further illustrated

with the application of
